

8 Head Shelf Welder

This machine utilized 8 welders to weld a screen into position in a single weld position. In this application the welders had to weld at the same time to insure the screen would be pulled taught. The fixture is on a slide for easy operator loading. Six welders are hub mounted but 2 of the welders are mounted on a bridge so the fixture and parts can be moved to the weld position. The customer tried heat staking to save money but the screen would not stay taught.
